

INTRODUCING

Promotional Brochure

SUNDRE BARLEY

Sundre is a top yielding, smooth awned conventional barley with class leading grain and forage yields, distributed in a new and unique way. Between the outstanding traits of this barley and the unique method of distribution, Sundre should become the dominant feed barley in Western Canada.

It has the highest grain yield of any barley ever developed at Lacombe, and has one of the highest forage yields, outperforming AC Lacombe and Vivar by a huge margin of 12%.

Sundre has excellent multiple gene disease resistance and was found to be resistant to diseases in Canada, the United States and Mexico. It is susceptible to some diseases, which are controlled with seed treatments, and could be susceptible to lodging under very high fertility conditions.

On one field yield exceeded 160 bushels/acre with very little lodging. Even more amazing, this field was hit with three small late season hailstorms and over 25 bushels/acre (as per crop insurance estimate) was knocked out of the heads and laying on the ground at harvest time. Provincial average is about 50 bushels per acre.

Sundre exhibits a high level of competitiveness, making it ideal in a multiple grain forage blend or for grazing.
